### SMART Modular Technologies launches 2 new 4GB DIMMs

21 Dec 2006

Memory module manufacturer SMART Modular Technologies has unveiled two new 4GB dual in-line memory modules (DIMMs).

The two four-rank modules are DDR2-667 registered and can populate blade servers with 32GB of high-speed memory.

The 4GB DIMM market is set for growth in 2007, as manufacturers of high-performance computing (HPC) servers aim to maximise system memory density. Blade servers, according to Semico Research, are set to account for between 20 per cent and 30 per cent of the total server market by 2010.

Bob Merritt, vice president of Semico Research, said: "But even more significant [than the market share increase of blade servers] is the related growth in memory demand. We expect that the average amount of blade server memory will double every two years."

Mike Rubino, SMART Modular Technologies' engineering vice president, explained the company was addressing the need of HPC server manufacturers to provide maximum system memory density

He said: "Our early investments in technology are transforming SMART's ability to offer leading-edge, high-density modules in a variety of form factors at competitive prices."
